Assignment 4

Deploying an applicatoin on Elastic beanstalk

1.Create an elastic beanstalk application

2.Create web server environment

3.Deploying a sample application

Elastic Beanstalk > Getting started
Create a web app
Create a new application and environment with a sample application or your own code. By creating an environment, you allow Amazon Elastic Beanstalk to manage Amazon Web Services resources and permissions on your behalf. Learn more
Application information
Application name
Up to 100 Unicode characters, not including forward slash (/).
Application tags
Apply up to 50 tags. You can use tags to group and filter your resources. A tag is a key-value pair. The key must be unique within the resource and is case-sensitive. Learn more

Select environment tier
Amazon Elastic Beanstalk has two types of environment tiers to support different types of web applications. Web servers are standard applications that listen for and then process HTTP requests, typically over port 80. Workers are specialized applications that have a background processing task that listens for messages on an Amazon SQS queue. Worker applications post those messages to your application by using HTTP.
Web server environment
Run a website, web application, or web API that serves HTTP requests.
Learn more
Worker environment
Run a worker application that processes long-running workloads on demand or performs tasks on a schedule.

Swap environment URLs
When you swap an environment's URL with another environment's URL, you can deploy versions with no downtime. Learn more
Swapping the environment URL will modify the Route 53 DNS configuration, which may take a few minutes. Your application will continue to run while the changes are propagated.
